Bios 6301: Assignment 6

Lydia Yao

Due Tuesday, 26 October, 1:00 PM

$5^{n=day}$ points taken off for each day late.

40 points total.

Submit a single knitr file (named `homework6.rmd`), along with a valid PDF output file. Inside the file, clearly indicate which parts of your responses go with which problems (you may use the original homework document as a template). Add your name as `author` to the file's metadata section. Raw R code/output or word processor files are not acceptable.

Failure to name file `homework6.rmd` or include author name may result in 5 points taken off.

Question 1

16 points

Obtain a copy of the football-values lecture. Save the five 2021 CSV files in your working directory.

Modify the code to create a function. This function will create dollar values given information (as arguments) about a league setup. It will return a data.frame and write this data.frame to a CSV file. The final data.frame should contain the columns 'PlayerName', 'pos', 'points', 'value' and be orderd by value descendingly. Do not round dollar values.

Note that the returned data.frame should have `sum(posReq)*nTeams` rows.

Define the function as such (10 points):

```
# path: directory path to input files
# file: name of the output file; it should be written to path
# nTeams: number of teams in league
# cap: money available to each team
# posReq: number of starters for each position
# points: point allocation for each category
ffvalues <- function(path, file='outfile.csv', nTeams=12, cap=200, posReq=c(qb=1, rb=2, wr=3, te=1, k=1
                     points=c(fg=4, xpt=1, pass_yds=1/25, pass_tds=4, pass_ints=-2,
                              rush_yds=1/10, rush_tds=6, fumbles=-2, rec_yds=1/20, rec_tds=6)) {
  ## read in CSV files

Import the HAART dataset (`haart.csv`) from the GitHub repository into R, and perform the following manipulations: (4 points each) 1. Convert date columns into a usable (for analysis) format. Use the `table` command to display the counts of the year from `init.date`.

```
df <- read.csv('haart.csv', header=TRUE, stringsAsFactors=FALSE)
df$init.date <- as.POSIXct(df$init.date, format = "%m/%d/%y")
df$last.visit <- as.POSIXct(df$last.visit, format = "%m/%d/%y")
df$date.death <- as.POSIXct(df$date.death, format = "%m/%d/%y")
table(df$init.date)
```

```

2. Create an indicator variable (one which takes the values 0 or 1 only) to represent death within 1 year of the initial visit. How many observations died in year 1?

```
hold <- difftime(df$date.death, df$init.date, units="days")
hold.tf <-hold < 365
hold.tf[is.na(hold.tf)] <- 0
df[, 'death1y'] <- hold.tf
table(hold.tf)[2]
```

```
##  1
## 92
```

3. Use the `init.date`, `last.visit` and `death.date` columns to calculate a followup time (in days), which is the difference between the first and either the last visit or a death event (whichever comes first). If these times are longer than 1 year, censor them (this means if the value is above 365, set followup to 365). Print the quantile for this new variable.

```
for(i in 1:nrow(df)) {
  df[i, 'followup'] = min(365, difftime(min(c(df[i,'last.visit'], df[i,'date.death']),na.rm=T), df[i, '
}
quantile(df$followup, na.rm=TRUE)
```

```
##       0%      25%      50%      75%     100%
##   0.0000 320.7188 365.0000 365.0000 365.0000
```

4. Create another indicator variable representing loss to followup; this means the observation is not known to be dead but does not have any followup visits after the first year. How many records are lost-to-followup?

```
for(i in 1:nrow(df)) {
  if (df[i, 'followup'] < 365 & is.null(df[i, 'death.date'])){
    df[i, 'lost-to-followup'] = 1
  } else {
```

```
    df[i, 'lost-to-followup'] = 0
  }
}
```

5. Recall our work in class, which separated the `init.reg` field into a set of indicator variables, one for each unique drug. Create these fields and append them to the database as new columns. Which drug regimen are found over 100 times? `18 new columns are created, one for each drug. From the different regiments, "3TC, AZT, EFV" and "3TC, AZT, NVP" both had over 100 times.`

```
over100 <- table(df$init.reg)
over100[over100 > 100]
```

```
##
## 3TC,AZT,EFV 3TC,AZT,NVP
##         421         284
```

```
for(i in 1:nrow(df)) {
  hold = strsplit(df[i, 'init.reg'], ',')
  for (j in hold){
    df[i, j] = 1
  }
}
```

6. The dataset `haart2.csv` contains a few additional observations for the same study. Import these and append them to your master dataset (if you were smart about how you coded the previous steps, cleaning the additional observations should be easy!). Show the first five records and the last five records of the complete (and clean) data set.

```
library(plyr)
df2 <- read.csv('haart2.csv', header=TRUE, stringsAsFactors=FALSE)
df2$init.date <- as.POSIXct(df2$init.date, format = "%m/%d/%y")
df2$last.visit <- as.POSIXct(df2$last.visit, format = "%m/%d/%y")
df2$date.death <- as.POSIXct(df2$date.death, format = "%m/%d/%y")
hold <- difftime(df2$date.death, df2$init.date, units="days")
hold.tf <-hold < 365
hold.tf[is.na(hold.tf)] <- 0
df2[, 'death1y'] <- hold.tf
for(i in 1:nrow(df2)) {
  df2[i, 'followup'] = min(365, difftime(min(c(df2[i,'last.visit'], df2[i,'date.death']),na.rm=T), df2[i
}
for(i in 1:nrow(df2)) {
  if (df2[i, 'followup'] < 365 & is.null(df2[i, 'death.date'])){
    df2[i, 'lost-to-followup'] = 1
  } else {
    df2[i, 'lost-to-followup'] = 0
  }
}
for(i in 1:nrow(df2)) {
  hold = strsplit(df2[i, 'init.reg'], ',')
  for (j in hold){
    df2[i, j] = 1
  }
}
df3 <-rbind.fill(df, df2)
head(df3, 5)
